Child Mind Institute

Introduction

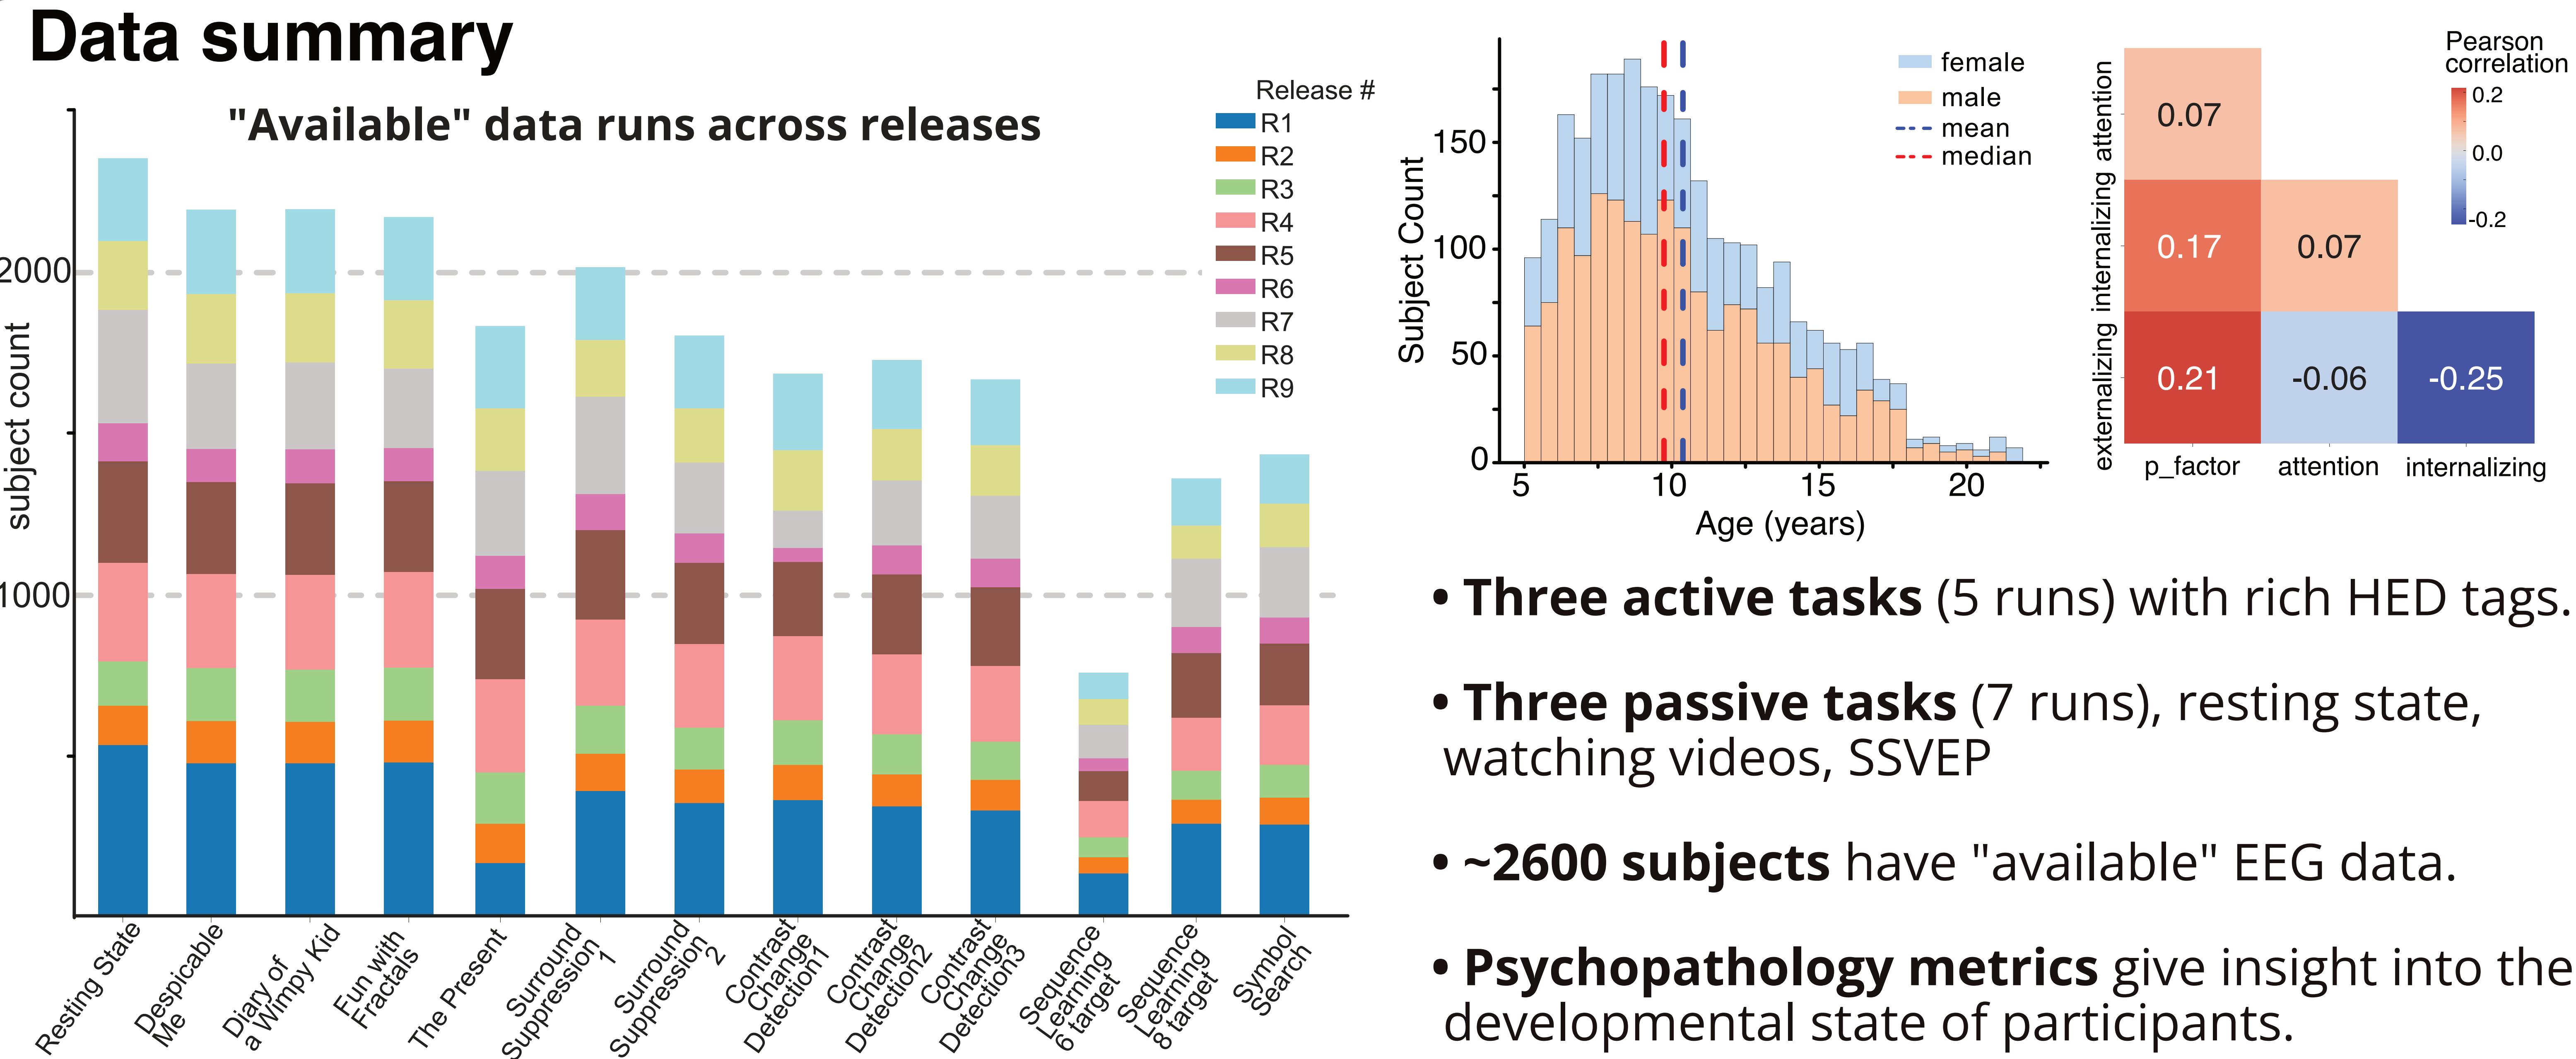

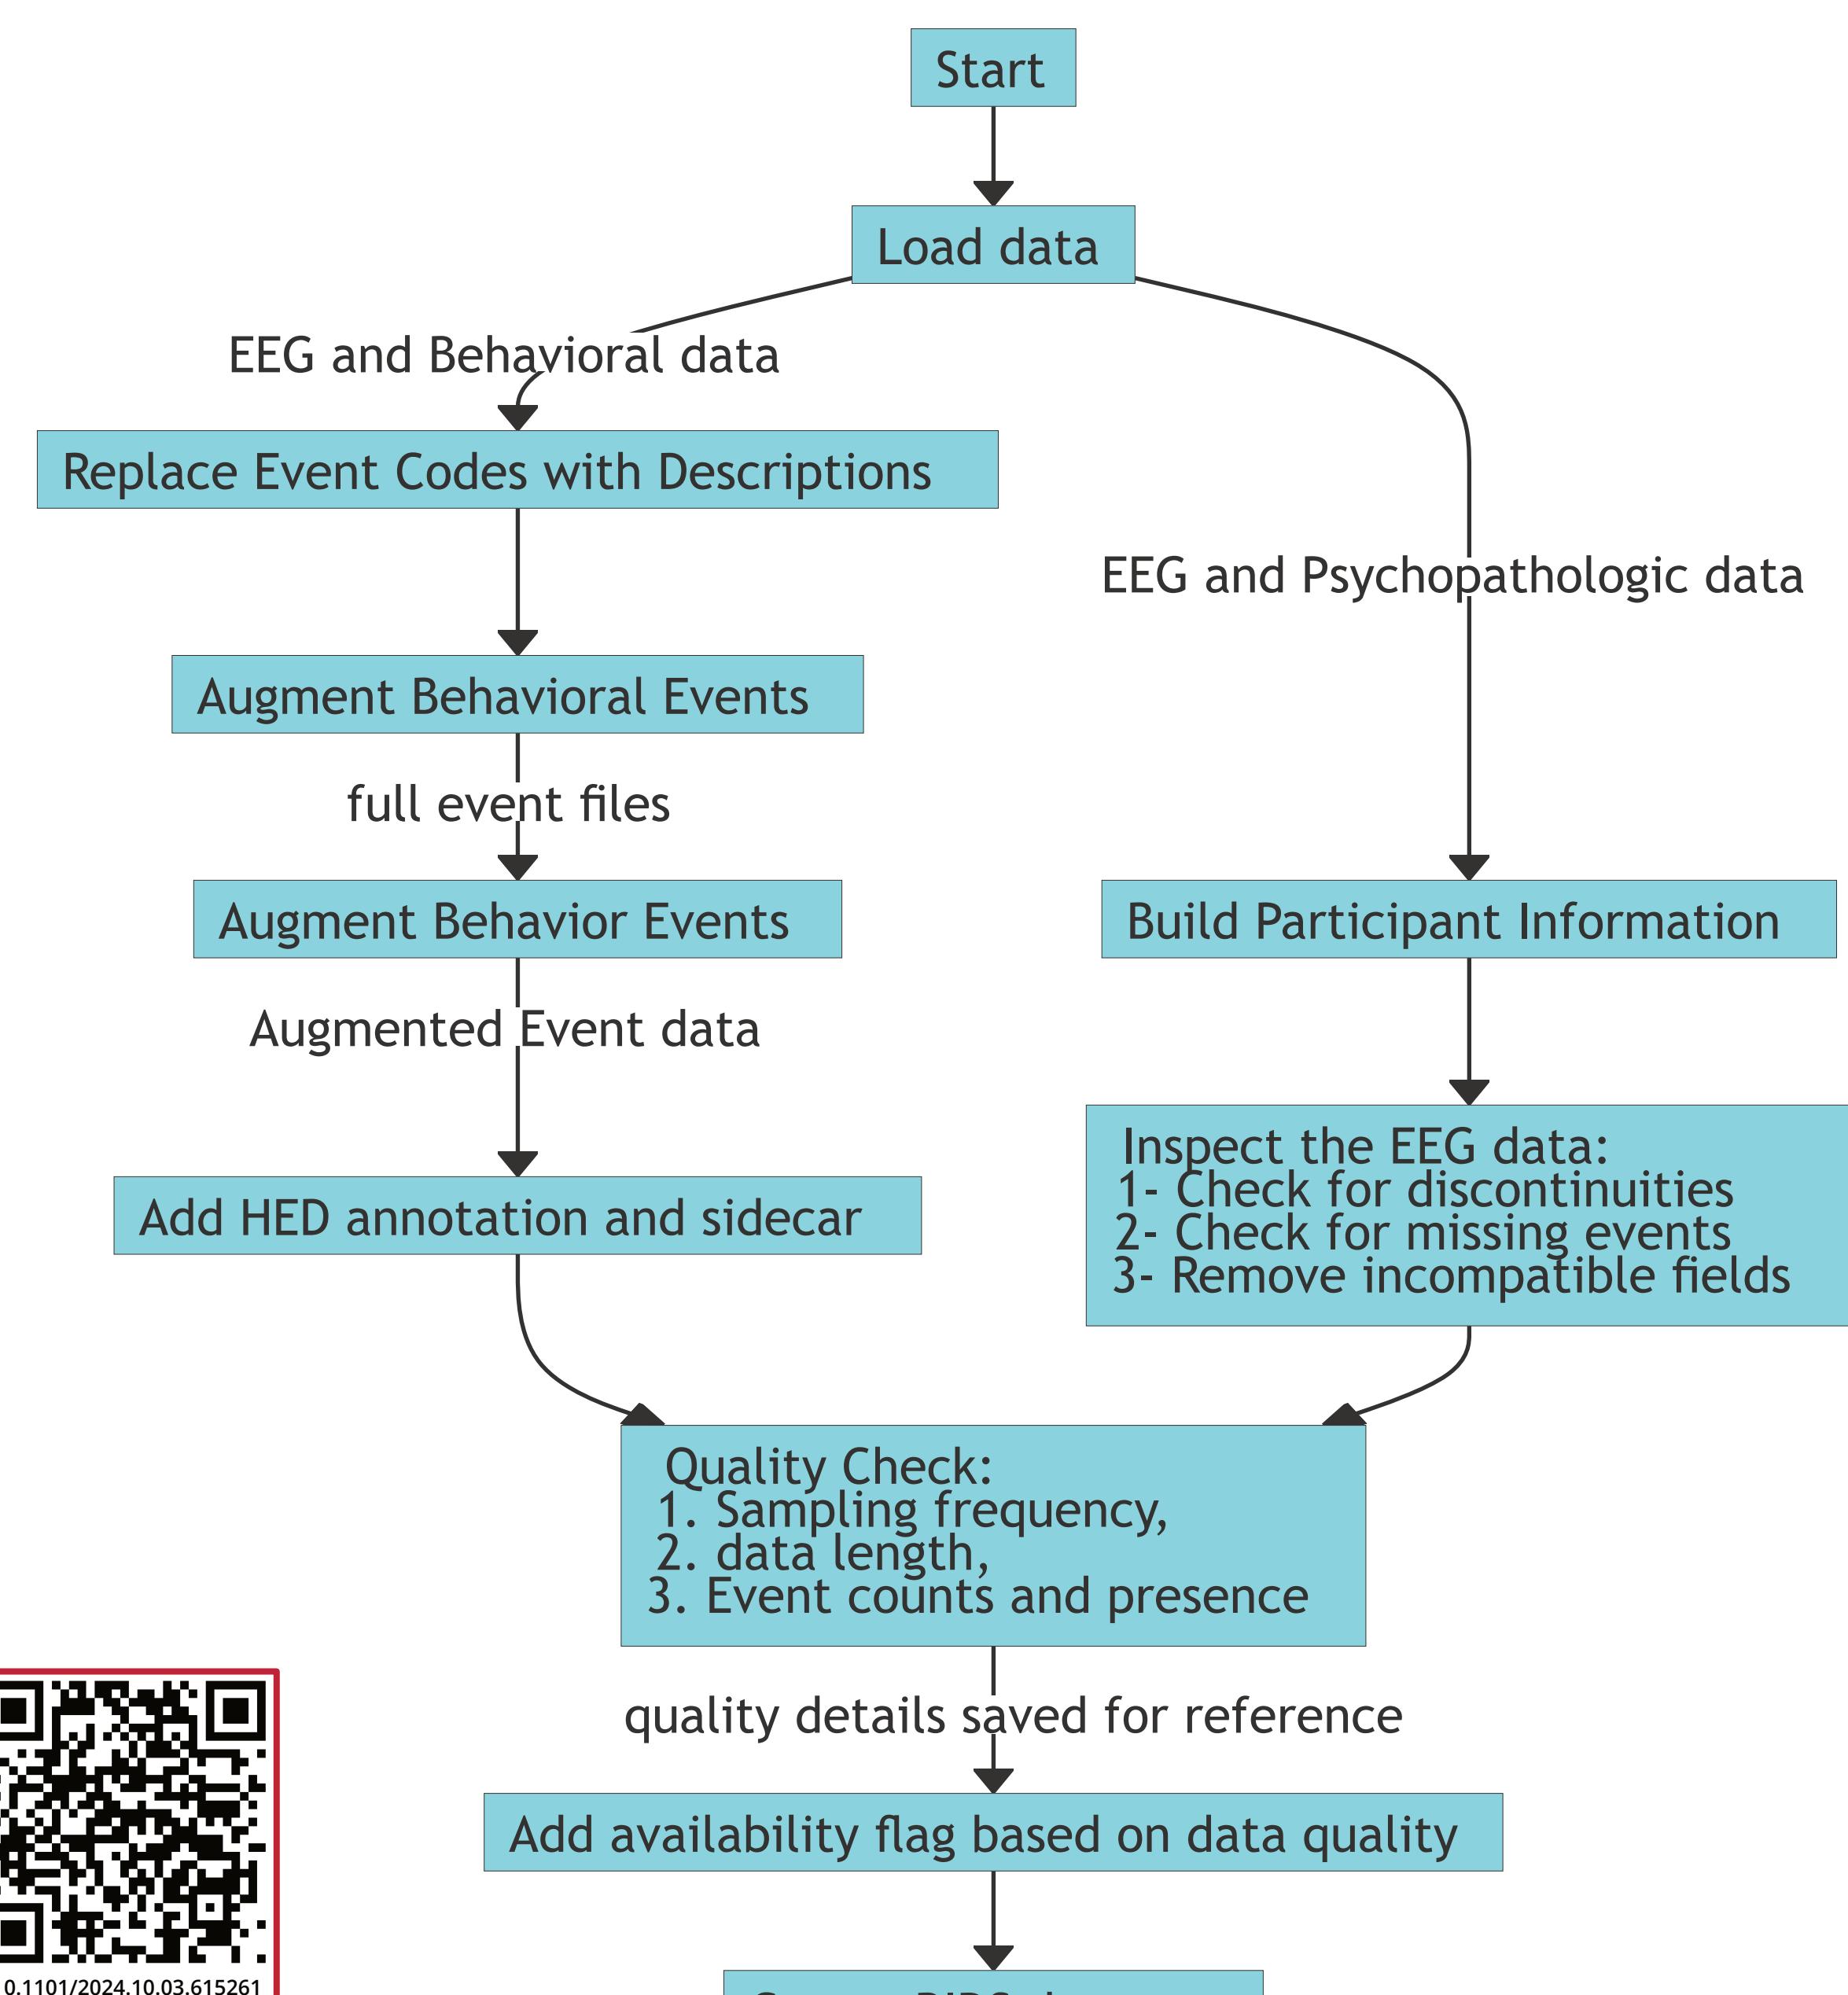

- The HBN project [1] spans ~5000 subjs (5-21yo) with fMRI, EEG, Eyetracking, and psychopathological data.
 - Data of ~2600 subjects have been realeased in the span of 9 Releases. EEG/Eyetracking data require significant curation to become "analysis-ready."

Purpose: Curate HBN EEG data with rich task event information and personal metadata for downstream research.

BIDS & Hierarchical Event Descriptors (HED) provide a FAIR structure for data sharing.

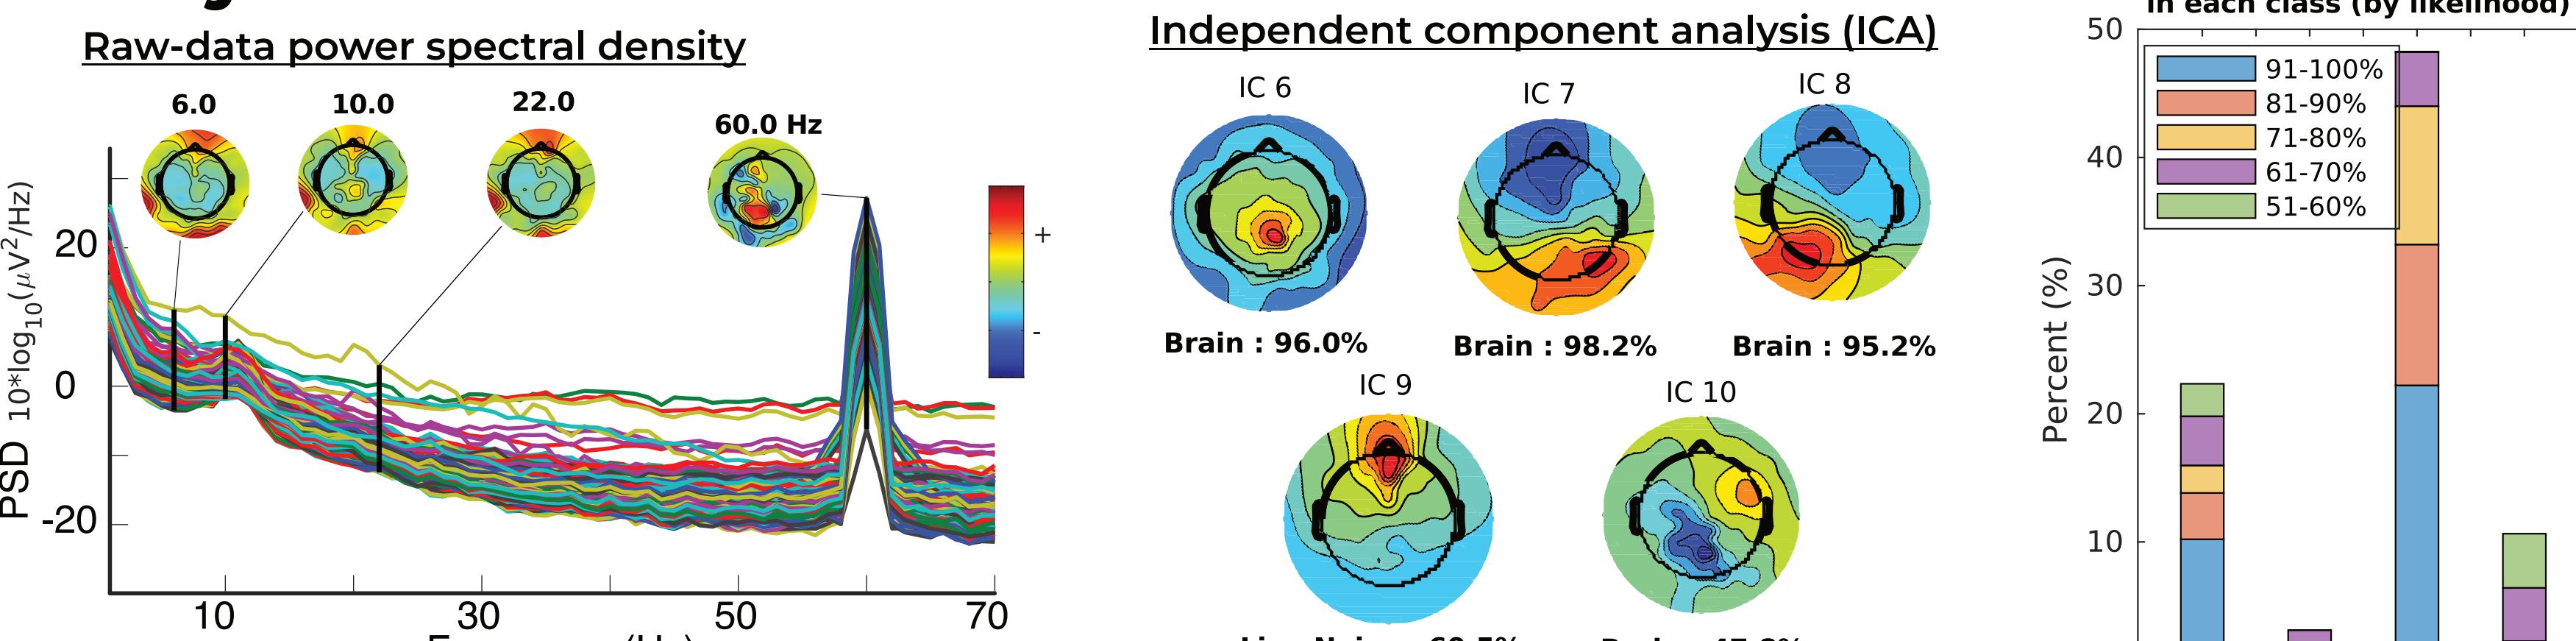

Data curation

EEG data was augmented with the behavioral responses (seperately shared on HBN), complemented with psychopathological factors, and series of quality chekcs.

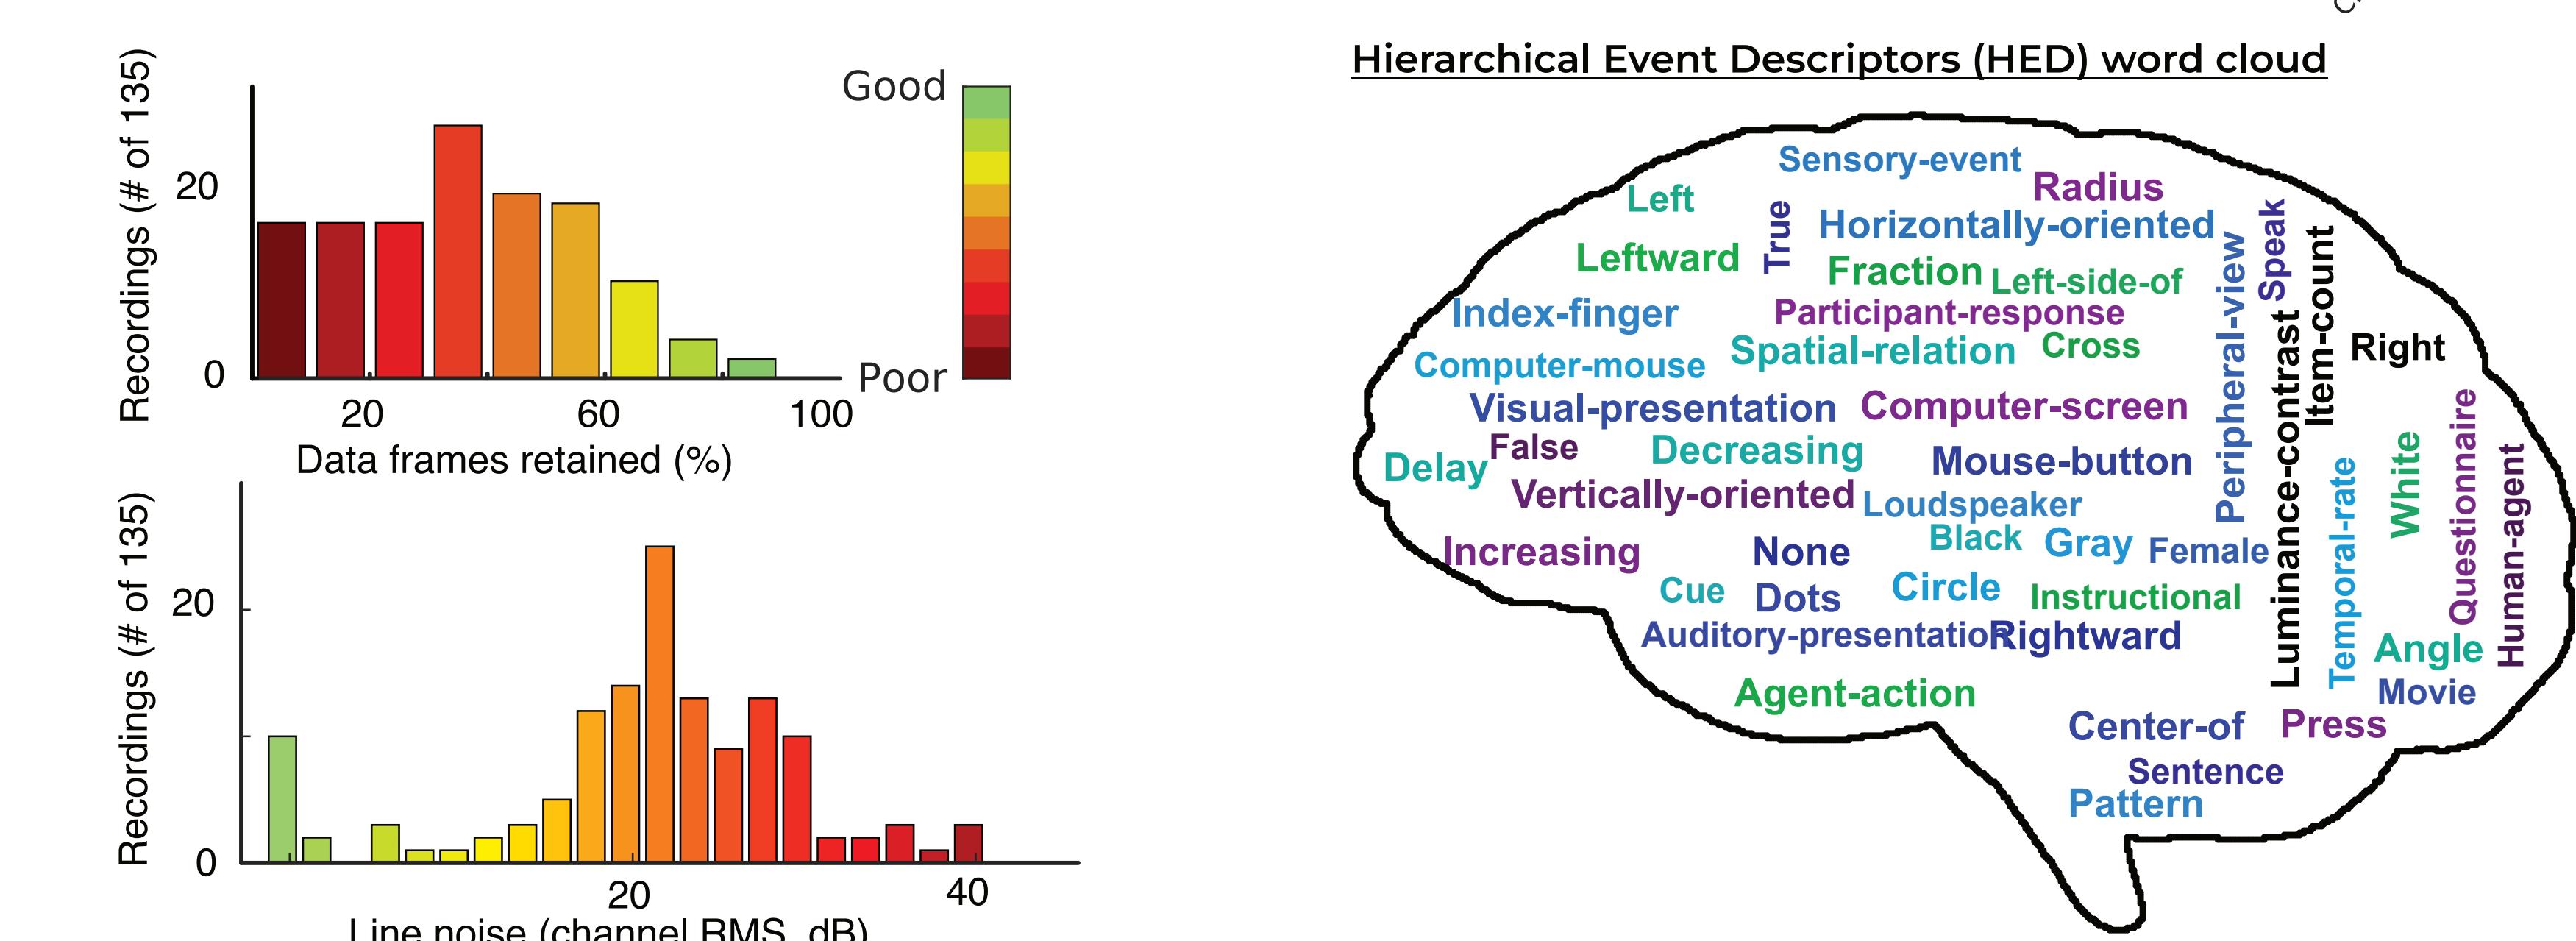

Dataset metrics on NEMAR.org

Subject-level metrics

Dataset-level metrics

- **Subject-level metrics** provide granular data-quality insights.

- **Dataset-level metrics** give an overall view of the dataset quality, helping researchers decide which datasets to use.

- **Hierarchical Event Descriptors (HED)** annotation provide transparent annotation for experiments and event markers.

Conclusions

- HBN-EEG is the largest and most comprehensive open EEG dataset.
 - Free not-for-profit compute/storage resources on **NEMAR** and **NSGportal**^[2] helps analyze these datasets.
